## Turn Academic Papers into Engaging Video Presentations

Saral AI seamlessly transforms your research papers into professional video presentations, utilizing AI-powered scripts, customized slides, and natural voice narration.

## How It Works

Our streamlined workflow transforms your research papers into professional presentation videos in just a few steps.

### Paper Upload

Upload research papers via arXiv links or direct LaTeX files. Our system automatically extracts content and figures.

### AI Script Generation

Generate engaging presentation scripts using advanced AI models like Gemini and GPT for educational content.

### Voice Synthesis

Convert scripts to natural-sounding audio narration with support for multiple languages including Hindi.

### Video Production

Automatically create professional presentation videos combining slides, narration, and visual elements.

### What you can do:

- Upload research papers from arXiv or LaTeX
- Generate AI-powered presentation scripts
- Create professional educational videos

By signing in, you agree to our [terms of service](#) and [privacy policy](#)

### Upload Research Paper

Choose your upload method to get started

#### LaTeX Source

Upload ZIP file containing  
LaTeX source code and  
figures

#### PDF Document

Upload research paper as  
PDF (text and images will  
be extracted)

#### arXiv Import

Import paper directly from  
arXiv using URL

#### Upload LaTeX Source

Drag and drop your ZIP file here, or click to browse

Maximum file size: 50MB  
Accepted format: ZIP files only

✓ Process LaTeX File

#### Upload Guidelines

- **LaTeX ZIP:** Include all .tex files, figures, and bibliography files
- **PDF Upload:** Ensure text is selectable (not scanned images)
- **arXiv Import:** Use the full URL from the paper's arXiv page
- All uploads are processed securely and temporarily stored

Once you Upload your paper  
Hit Process button

Have you ever wondered how social media platforms or recommendation systems learn from the vast amounts of data they collect? Often, they use something called Graph Neural Networks, or GNNs for short. Think of a GNN as a way for a computer to understand relationships between different things, like friends on a social network or products in a shopping catalog. The problem is that these GNNs can be vulnerable. If someone intentionally puts bad information into the system, or if there are simply errors in the data, it can throw the whole network off and lead to incorrect results. Imagine if someone spread false rumors on a social network it could negatively impact everyone connected! That is why this research looks at how to "unlearn" bad information from a GNN.

### Slide Bullet Points

- Introduce Graph Neural Networks (GNNs) as tools for understanding relations
- Highlight the vulnerability of GNNs to data manipulation and errors.
- Emphasize the research focus on "unlearning" bad information from GNNs.

+ Add bullet point
